# 1<sup>st</sup> Edition

# Spill Response Guidelines<sup>©</sup>

This *guidance document* outlines the industry standards for responding to a spill incident involving an uncontrolled release of *flammable* or *combustible* liquids in Canada.

**May 2021** 

THIS GUIDANCE DOCUMENT IS AVAILABLE **FREE-OF-CHARGE**. PLEASE RESPECT **COPYRIGHT PROTECTION** AND DON'T REPRODUCE OR SELL ANY PORTION WITHOUT PERMISSION.

#### **Guidelines & Training**

The 2021 **Spill Response Guidelines** (1st Edition) was prepared by NorthWest Response Ltd., Smithers, British Columbia, Canada.

This document outlines the systematic process of how to respond to a spill incident involving TDG Class 3 Flammable Liquids.

This guideline was written as a reference document to the on-line Spill Response Training course available at: www.fueltraining.ca

The *spill response training course* was designed by NorthWest Response Ltd and will issue a <u>Spill Response Certificate</u> for participants that achieve an 80% on the five training *Modules* that include:

- 1. Spill Prevention & Preparedness;
- 2. Spill Incident Assessment, Safety Assessment and Environmental Impact Assessment;
- 3. Plan & Mobilize an effective response;
- 4. Implement an Action Plan to contain and recover the spill;
- 5. Document and prepare an end-of-spill Closure Report.

The <u>Spill Response Guidelines</u> is not a legal document however, if implemented, it will assist your operation in meeting the test of "due diligence".

#### **Worker Certification Training**

On-Line Spill Response Training at: www.fueltraining.ca (now available)

This course complies with the training and awareness requirements outlined in:

**Fire Code** (All Provincial and the National Fire Code):

• **Training.** All employees involved in storage and handling of dangerous goods shall be trained in safe handling and storage procedures and correct responses to an emergency situation. Division B, Part 3 – Section 3.2.7.15 & Section 3.3.4.6

#### Occupational Health & Safety (Provincial and Federal OH&S):

- OH&S Section 17.5 (1)(b)
  - Every employer shall: prepare emergency procedures if there is a possibility of an accumulation, spill or leak of a hazardous substance in a workplace controlled by the employer, to be implemented in the event of such an accumulation, spill or leak;
- OH&S Section 17.6 (1)
  - (a) the procedures to be followed: in the event of an emergency; and
  - (b) the use and operation of emergency [spill response] equipment provided by the employer [to control the spill or leak].

#### **Transport Canada** – **Dangerous Goods** (Federal Regulation):

• Section 6.2 (k) The reasonable emergency measures the person must take to reduce or eliminate any danger to public safety that results or may reasonably be expected to result from an accidental release of the dangerous goods.

#### **BC Environmental Management Act** (Provincial):

- Division 2.1 Spill Preparedness, Response and Recovery Section 91.2 (1) (c) Responsible Persons Spill Response:
  - Ensures that persons with the skills, experience, resources and equipment necessary to properly deal with the spill.

#### **REVENTION & PREPAREDNESS**

#### Section 1

#### **PREVENTION**

**Spill Prevention** includes the *action* of stopping a spill from happening. This guideline outlines a modified version of the ISO-14001 Environmental Management System for establishing risk.

- Identify the operational activities involving storage, handling and transportation of all products including dangerous goods and hazardous wastes that could spill to:
  - a. The natural environment including land, air and water.
  - b. The infrastructure environment either by entering, flooding, surrounding or migrating underneath a structure or man-made object.
- 2. Conduct a Risk Assessment of the Operational Activities identified in 1a and/or 1b.
  - a. Risk Rank the operational activities to identify the highest risks:

#### Risk = Probability x Consequence

- b. Develop *Procedures* to manage or control the highest risk aspects identified.
- c. Review the *Procedures* to ensure they are in compliance with existing *Standards* and *Guidelines*
- d. Implement a training program that provides an educational awareness of the Standards and Guidelines as it relates to the managing risks and implementing procedures.
- 3. Using the list of Operational Activities, the Risk Management Procedures and applicable Standards and Guidelines prepare a <u>Spill Prevention Plan</u> that can be used to document and verify the test of *due diligence*.

#### **PREPAREDNESS**

**Spill Preparedness** includes the process of *anticipating* a *credible spill incident* and the *actions* taken to implement countermeasures.

- Establish credible spill scenarios for the site by reviewing the high-risk aspect that involve the storage, handling and transportation of all products including dangerous goods and hazardous wastes. The credible spills should include worst case scenarios entering:
  - a. The natural environment including land, air and water.
  - The infrastructure environment either by entering, flooding, surrounding or migrating underneath a structure or man-made object.
- 2. Develop countermeasures for the *credible spills* including *worst case scenarios*:
  - a. Prepare & purchase an equipment list to implement the countermeasures
  - b. Prepare Response Procedures to implement the countermeasures.
  - Implement a training program that provides an opportunity to test and practice the countermeasures.
- Develop an Emergency Response Plan (ERP) that reflects the scope of the operation, potential risks and credible spills scenarios.
  - a. The ERP should identify the person(s) who are authorized to implement the plan.
  - b. The ERP should outline the response procedures required to implement the countermeasures.
  - c. The ERP should be reviewed annually and tested regularly to ensure response personnel are familiar with the countermeasures.

#### LEGAL ISSUES

#### Legal Issues & Due Diligence LEGISLATION

- Check Federal, Provincial & Territorial Legislation to ensure that you are following the legal requirements:
  - -Spill Reporting Requirements

#### **DUE DILIGENCE**

- A legal defense that reasonable measures were taken to prevent an incident that could impact the environment.
- A legal defense that reasonable actions were taken to minimize the impact on the environment.
- A legal defense that reasonable actions were taken to restore a site to its original condition or provide reasonable compensation when restoration is not possible.

#### REPORTING

- Report the volume and the product spilled.
- Report the adverse effect or potential impact of the spill.
- Report any spill that has entered or has the potential to enter a water course.

#### **NOTES/PHOTOS**

 Keep thorough-detailed notes and include timeline-photodocumentation of the incident.

#### **DOCUMENTATION**

- Document the assessments: Spill, Safety & Environment.
- Document the *planning* process to justify the response.
- Document the *actions* taken to contain the incident.
- Document the *clean-up* & *restoration* measures.

#### PROGRESS REPORTS

- Prepare a daily progress report that outlines the overall Objectives and Targets that were achieved within a specified timeframe.
- Provide justification for any targets not achieved.
- Communicate with Agencies, First Nations, Stakeholders, Individuals & Communities.

INITIAL ASSESSMENT – Complete FORM 2 Section						
SPILL ASSESSMENT	SAFETY ASSESSMENT	ENVIRONMENTAL ASSESSMENT				
Initial Spill Assessment – Complete FORM 2A  Determine the Product Spilled:  Check Placards & Labels.  TDG Class & Subsidiary Class.  Check the Shipping Document.  Check Shipping Name.  Packing Group.  Understand the characteristics of the product:  Determine Fate & Effects of the product(s).  SDS – WHMIS Information.  ER Guidebook (Transport Canada – CANUTEC).  Supplier Information and ERAP.  Determine Tank Volume:  Determine the max potential volume or the total volume of the tank(s) – means of containment.  Assess the remaining product in the tank:  If the tank is not accessible, then assume the tank is full.  Assume the worst-case scenario to ensure the response efforts are not under-estimated.  Assess the Potential Migration Pathways  Assess the topography and determine if product has spread beyond the immediate spill area.	Initial Safety Assessment — Complete FORM 2B Chemical Safety Assessment:  Chemical Vapors & Flash Point. Lower Explosive Limit (LEL). Corrosive (pH). Chemical Contact: Routes of Entry: Inhalation; Skin Absorption; Ingestion. PPE: HazMat Level A, B, C or D.  Physical Safety Assessment: Incident Stability. Tank Integrity. Buried Utilities: Call-Before-You-Dig. Working on or over water. Vehicular Traffic.  Environment (Field) Safety Assessment: Seasonal Weather & Risks. Terrain Conditions & Access. Water Safety - Creeks & Streams: Low to High Energy. Foreshore Access.  Environment (Indoor) Safety Assessment	Environmental Assessment - Complete FORM 2C Aquatic Habitat Assessment: Tables 2A & 2B  Confined Water Course - Flowing Water. Confined Water Course - No Water Flow. Unconfined Water Course - Open Water.  Terrestrial Habitat Assessment: Table 2C  Unique Features of the Habitat or Region. Soil Characteristics of the Habitat or Region. Forested Habitat. Mountain Habitat. Grassland Habitat. Grassland Habitat. Desert Habitat. Flora Assessment: Table 2D Common Species within Terrestrial Habitat. Endangered or Species-at-Risk. Culturally Significant. Agricultural Harvest - Crop.  Fauna Assessment: Table 2E Land: Mammals & Reptiles. Water: Fish & Amphibians. Air: Migratory & Resident Birds.  Land Use & Infrastructure Assessment: Table 2F				
<ul> <li>Assess the soil characteristics and identify any impermeable or confining layers.</li> <li>Confined Water Courses:</li> </ul>	<ul><li>Confined Space/ Egress Points.</li><li>Vapors and Ventilation.</li><li>Accessibility.</li></ul>	<ul> <li>Agriculture Infrastructure.</li> <li>Park &amp; Recreational Infrastructure.</li> <li>Residential Infrastructure.</li> </ul>				
<ul> <li>Can be mechanically contained with spill response equipment.</li> <li>Unconfined Water Courses:</li> <li>Cannot be mechanically contained with spill</li> </ul>	<ul> <li>Human Health &amp; Safety Assessment:</li> <li>Stress &amp; Fatigue.</li> <li>Adequate Resources.</li> </ul>	<ul> <li>Commercial Infrastructure.</li> <li>Industrial Infrastructure.</li> <li>Human Health &amp; Community Impact: Table 2G</li> </ul>

PLAN & MOBILIZE - Complete FORM 3 Section 3							
RESPONSE PLAN	SAFETY PLAN	ENVIRONMENTAL PLAN					
Response Plan & Mobilize Objective – Complete FORM 3A Plan to address the spill containment issues:  Spill Plan - Land see Table 3A Containment Options: Diversion Trench. Recovery Trench. Interceptor Trench. Stockpile & Windrow. No Migration – contained or minor staining. Recovery, Storage, Disposals: No recovery possible or too dangerous. Surface Absorbents. Excavate & Dispose. In-Situ Treatment. In-Situ Burn. Haz-Waste Vac Truck.  Spill Plan – Confined Water see Table 3B Tarp Containment. Culvert Block or Modified Culvert Block. Underflow Containment. Water-Gate. Storm-Drain Containment. Aqua-Dam Containment. Aqua-Dam Containment. Containment & Deflection Booms. Absorbent Boom Deflection. Groundwater monitoring or recovery wells.  Spill Plan – Unconfined Open Water see Table 3B Containment Boom. Exclusion Booms. Herring-Bone Boom Configuration. Foreshore Seal Boom.	Safety Plan & Mobilize Objective – Complete FORM 3B  Plan on how to address the safety issues:  Chemical Safety Plan  Job Hazard Analysis (JHA). Site Safety Protocol. Vapours, Flash Point & LEL. De-Contamination Requirements. Evacuation & Public Safety. Response PPE & Assess Routes of Entry.  Physical Hazards Safety Plan Job Hazard Analysis (JHA). Incident Stability. Equipment used to lift, shift, pull, push and dig. Overhead or Buried Utilities: Call-Before-You-Dig.  Work Environmental Safety Plan Job Hazard Analysis (JHA). Working under adverse weather conditions. Land: Accessibility & Instabilities. Water: Accessibility, Flows, Depth & Foreshore. Indoor: Accessibility, Egress, Lock-out, Confined Space, Visibility & Ventilation.  Human Health & Safety Plan Job Hazard Analysis (JHA). Stress, Fatigue & Pressure on Responders. Adequate resources to respond. Public Security: Restricted Access, Detours & Evacuation	Environmental Plan & Mobilize Objective - Complete FORM 3C Characterize & Prioritize the Receiving Environmental:  Aquatic Habitat, Flora & Fauna  Confined Water Courses - Flowing. Confined Water Courses - Not Flowing. Unconfined Water Courses - Open Water.  Foreshore Veg. Wetland Plants Emergent Plants Grasses  Terrestrial Habitat, Flora & Fauna Forested; Mountain Grassland; Desert  Coniferous Grasses Forested; Mountain Grassland; Desert  Conferous Forested; Mountain Fo					

# Response ACTION — Complete FORM 4

**Section 4** 

End-of-Spill CLOSURE Section					
CLOSURE OBJETIVES	DAILY PROGRESS REPORTS	CLOSURE REPORT			
Closure Objectives: Define the Closure Objectives: These include the goals and parameters that were established at the outset of the response that, when implemented, will lead to a confirmation of end-of-spill for the incident:  Outline the Goals & Parameters to establish end-of-spill:  Delineation of impact.  Excavate to remove source of contamination.  Contaminated waste & debris removal.  Site clean-up & restoration criteria.  Ex-situ or in-situ treatment.  Pre-incident condition or negotiated compensation.  Spill Response Closure Report:  Documented summary should include:  Product, Volume & Cause.  Correlation of spill volume and waste volume.  Response Measures taken to limit or mitigate:  Personal Injury – responders.  Property or Infrastructure damage & impacts.  Impact on the environment.  Impacts on individuals or community.  Disposal vs. Treatment:  Waste Recovery & Storage:  Waste volume recovered and methodology of recovery.  Storage methodology.  Sampling protocol to characterize the waste material.  Document the waste management options to ensure that both cost effective and practical solutions are considered.  Outline the justification for how waste is managed.  Document Permits, Approvals and Exemptions associated with waste management.	<ul> <li>Daily Progress Reports:         <ul> <li>Daily Progress Reports provides a documented timeline of the response. It also outlines the response objectives, targets and implementation timelines.</li> </ul> </li> <li>Daily Progress Reports are used to update and communicate with:         <ul> <li>The Spill Contractor and the Responsible Party.</li> <li>Government Agencies: Municipal, Provincial &amp; Federal.</li> <li>First Nations Governments and Stakeholders.</li> <li>Individuals and Communities including Recreational &amp; Business Organizations.</li> </ul> </li> <li>Daily Progress Reports will document the response organization and status:         <ul> <li>Organization Structure: Incident Command System (ICS).</li> <li>Daily Field Notes &amp; Photo Documentation.</li> <li>Site Surveys &amp; Updated Site Diagrams.</li> <li>Summary of equipment, personnel &amp; resources on-site or on-route.</li> <li>Safety Assessment of the incident:</li></ul></li></ul>	End-of-Spill Closure Report: Review Objectives and Targets that were outlined.  Closure Report: Use the Daily Progress Reports to summarize the response: Assessments. Planning and Mobilization. Response Actions: Containment & Clean-up. Waste Management & Restoration.  Outline the cause of the spill or the circumstances that lead to the spill.  Outline the preventative measures & preparedness measures that emphasize Due Diligence.  Outline the "lessons learned" from the incident: Review the risk assessment matrix and what measures are required to manage the risk. Update or improve equipment. Updated or develop new procedures. Implement additional awareness or operational training.

# **Table 2C**

# **Assessing Terrestrial Habitat**

(used to complete FORM 2C)

<u>Defining Terrestrial Habitat:</u> The *natural environment* on land that supports the survival of animals, plants and organisms. Describe the four distinct terrestrial habitats: forests, mountains, grasslands and deserts.

	Forested	Mountain	Grassland	Desert
	Determining Factors:  Latitude Forest Floor Decay Soil Characteristics Forest Stage Description Forest Region Dry/ Wet Area  Boreal Forests Dominated with coniferous Northern latitude Colder climate Moderate-high precipitation  Temperate Broadleaf Forest Relatively moist soil Broad range of seasonal temperatures Dominated with deciduous	Determining Factors:  • Elevation  • Sun Exposure  • Soil Characteristics  • Latitude  • Precipitation  • Ambient Temp.  Foothill Zone Elevation < 400m  • Temperate coniferous  • Grasslands  Montane Zone Elevation Range: 400m-1200m  • Dense coniferous  • Lower canopy  • Exposed rock, moss,	Characteristics:  Low precipitation  Nutrient rich soil  Natural - undeveloped  Semi-natural - some development  Agriculture - developed  Natural*  No agriculture or fertilizers  Often low productivity  Semi-Natural*  Agricultural Activity  Very little fertilizers used  Natural balance between vegetative growth and grazing  Very little mechanical disturbance	Characteristics: Cold semi-arid desert  <300mm annual precipitation Temp ranges: +40°C to -5°C  Dry Shrub Grassland  Soil is dry, sandy and nutrient poor Open areas dominated by grass
errestrial Habitat	Montane Forest Region  Along mountain slopes  Mixed ecosystem depending on elevation and latitude  Dense coniferous stands  Grassland Zones  Riparian Woodland Zones  Desert Zones  Coast Forest Region	<ul> <li>Exposed Tock, Moss, ferns &amp; lichens evident</li> <li>Subalpine Zone         Elevation Range:         1200m-1900m         Directly below treeline         Stunted plant growth         Elevation &amp; sun exposure define climatic zones         Alpine Zone     </li> </ul>	*Nine-Habitats:  • Aspen - Moist, cooler environment  • Gully - Moist during the snowmelt then dry out  • Riparian - Adjacent to water courses; critical habitat  • Wetland - Water saturated environment: critical habitat  • Pond/ Lake - Open water bodies with varying depth  • Open Grassland - Open areas	Cliffs & Rock Outcrops • Fractured rock and caves - important habitat
Terr	Very wet environment     Mixed coniferous & broadleaf     Understory of mosses, ferns and shrubs     Columbia Forest Region     Columbia River Valley of South-East BC     Mixed deciduous: wet zones     Grassland Zones     Wetland Zones	Elevation Range: 1900m-2400m  Above treeline  Windy with low ambient temperatures  Low precipitation  Poor soil nutrient environment	dominated by grass  Rocky Talus/ Rock Outcrop - Fractured rock and caves - important habitat  Open Coniferous Forest - Grasslands with just enough moisture to support trees  Closed Coniferous Patch - North-facing slopes with higher moisture in soil	Open Ponderosa Pine Forests  Grasslands with just enough moisture to support trees
	Subalpine Forests  Cooler environment, longer winters & low precipitation Coniferous old growth Wet meadows Fen wetlands	Snow Zone Elevation >2400m • Permanent snow & ice	Agriculture      Crop Specific     Mechanical disturbance     Use chemical fertilizers and herbicides	

# Table 2D Assessing Environmental Receptors – Flora

(used to complete FORM 2C)

**<u>Defining Flora:</u>** All *plant life* found in a specific region habitat.

- *Objective*: To provide <u>awareness</u> of the diversity of plant life found in different terrestrial habitats.
- There are too many species to list and regional areas can have a significant variability in diversity.
- Examples of Common plant life in blue & Endangered species or at risk in red

	Forested	Mountain	Grassland	Desert		
	Determining Factors:  Forest Floor Decay  Stand Initiation  Stem Exclusion  Understory Re-initiation  Old Growth  Boreal Forest Region	Determining Factors:  Seasonal Temperature Precipitation Soil characteristics Sun Exposure Latitude Foothill Zone	Characteristics:  Low precipitation  Nutrient rich soil  Natural – undeveloped  Semi-natural – developed  Agriculture – developed  Natural*	Characteristics: Cold semi-arid <300mm annual precipitation Temp ranges: +40°C to -5°C  Dry Shrub		
	<ol> <li>Northern Region: White Spruce; Black Spruce; Larch</li> <li>Open Lichen Woodland: Spruce; Balsam, Fir; Jack Pine; White Birch; Trembling Aspen</li> <li>Lower Boreal Region: Trembling Aspen; Willow; Pinegrass</li> </ol>	Elevation <400m Lodgepole Pine; Trembling Aspen; Balsam Poplar; Paper Birch; Balsam Fir; Blue-Bunch Wheatgrass Rough Fescue	<ul> <li>No agriculture or fertilizers</li> <li>Often low productivity</li> <li>Semi-Natural*</li> <li>Agricultural Activity</li> <li>Very little fertilizers used</li> <li>Natural balance between vegetative growth and grazing</li> </ul>	Grassland Antelope-brush; Big Sagebrush; Grass; Hard fescue; Cacti: Little Prickly Pear Cactus		
t Life	Temperate Broadleaf Forest Oak; Maple; Birch Pine; Firs; Spruce	Montane Zone Elevation Range 400m-1200m Douglas Fir; Forage Grass, White Spruce, Lodgepole Pine; Ponderosa Pine; Bunchgrass; Sedges	<ul> <li>Very little mechanical disturbance</li> <li>*Nine-Habitats:</li> <li>Aspen -Trembling Aspen;         Snowberry; Snowberry; Blue         Wheatgrass; Timber Oat Grass;         Prairie Rose     </li> <li>Gully – Douglas Maple;</li> </ul>			
Flora – Plant	Montane Forest Region Pine; Spruce; Fir; Rhododendron; Ferns Pinegrass; Blue-bunch Wheatgrass	Subalpine Zone Elevation Range 1200m-1900m Alpine Fir; Engelmann Spruce; Ponderosa Pine in drier areas; Rough Fescue; Pinegrass	Saskatoon; Common Snowberry Riparian – Red-Osier Dogwood Wetland – Bulrush, Cattails; Willows; Aspen Pond/ Lake Cattail; Bulrush Open Grassland – Prairie Rose; Sagebrush; Choke Cherry Rocky Talus/ Rock Outcrop	Cliffs & Rock Outcrops Common Juniper Shrub; Saskatoon; Sagebrush		
표	Coast Forest Region Western Hemlock; Western Red Cedar; Sitka Spruce; Douglas Fir; Understory of Mosses, Ferns and Shrubs Columbia Forest Region	Alpine Zone Elevation Range 1900m-2400m Alpine Grasses, Sedges, Forbs; Mosses; Lichens and alpine flowers; Rough	Horse-brush; Common Juniper  • Open Coniferous Forest - White Current; Black gooseberry; Common Juniper; Rocky Mountain Juniper  • Closed Coniferous Patch - Red	Open Ponderosa		
	Sitka Spruce; Douglas Fir Lodgepole Pine; White-bark Pine Subalpine Forest Region	Fescue  Snow Zone	Elderberry  Agriculture	Pine Forests Ponderosa Pine; Blue-bunch		
	Pine; Spruce; Fir; Rhododendron; Ferns	Elevation >2400m Lichens and mosses on exposed rock surfaces	Crop Specific     Mechanical disturbance     Use chemical fertilizers & herbicides	Wheatgrass; Snowbrush; Rough Fescue; June-grass; Prairie Lupine		

# Table 2E Assessing Environmental Receptors – Fauna

(used to complete FORM 2C)

**<u>Defining Fauna</u>**: All *animal life* found in a specific region habitat.

- Objective: To provide <u>awareness</u> of the diversity of species found in different terrestrial habitats.
- There are too many species to list and regional areas can have significant variability in diversity.
- Examples of Common Species in blue; Endangered or Species-at-risk in red

	Forest	Mountain	Grassland	Desert

# Human Health & Communities

# **Table 2G** Human Health & Community

(used to complete FORM 2C)

#### **Defining Human Health and Communities:**

 Awareness of individual and community impacts resulting from direct and indirect impacts of the spill incident.

## **Direct Impacts**

#### **Chemical & Physical Impacts**

- Chemical
- Physical
- Mental health of victims Involved in the spill incident or the community response to an incident

#### **Contamination Impact**

Property or resources

#### **Access**

Delays and detours or restricted access to property

#### **Indirect Impacts**

#### **Social Impacts:**

 The effect on people & communities that can happen as a result of action or inaction

#### **Economic Impacts:**

 Financial or employment impacts due to the response efforts, impacts, the clean-up, disposal, monitoring or site restoration; and possible fines

#### **Recreational Impacts:**

• Impacts have restricted access a recreational site

#### **Aesthetic Impacts:**

 The beauty or unique feature of a site has been permanently altered or destroyed

#### Cultural Impacts:

• Significant activities including food gathering, fishing or hunting

#### **Archeological & Spiritual Impacts:**

Traditional sites are protected & anonymity is respected

# Reference #1A-C Recovery-Interceptor-Diversion Trenches™

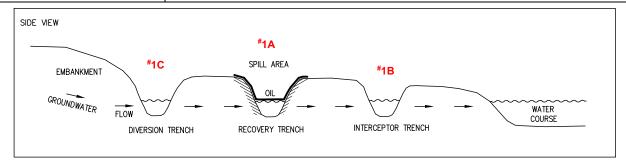

Objective: Containment of a spill on land.

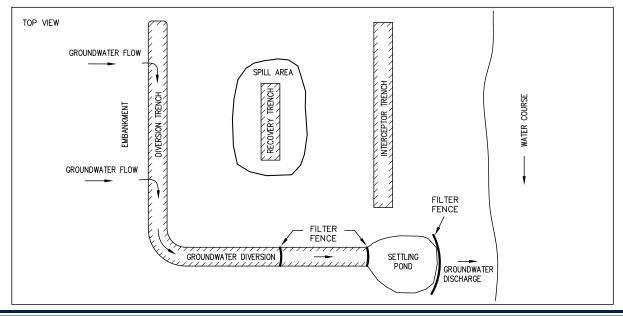

<u>Materials:</u> An excavator required to dig trenches. Consider using a vac-truck to continually pump the product and contaminated groundwater from the recovery trench. This will remove the contamination but also lower the water table within the trench and mitigate any further migration.

<u>Method:</u> \*1A. Begin at the spill area. Dig a recovery trench or pit through the centre of the spill and allow product to accumulate within the excavation.

**\*1B**. To ensure that the spill does not migrate into a water course, dig an interceptor trench downgradient of the recovery trench or spill area. This will be your monitoring point to confirm that product has not migrating beyond the spill area.

**\*1C**. If groundwater movement is evident and product is found in the interceptor trench, consider digging a diversion trench to divert clean groundwater around the spill area.

# Reference #1D

## SOP: In-Situ & Ex-Situ Treatment

Best Management Practices (BMP): This SOP will ensure that BMP are implemented when treating small volumes of hydrocarbon waste material.

#### Specifications for this SOP:

- The contamination is petroleum hydrocarbon based (synthetic oil will not bio-remediate)
- The source of the petroleum hydrocarbon contamination is from:
  - 1. Non-reportable spills to land, including: Class 3 Spills less than (<)100L / Leaks / Drips / Hydrocarbon Stains; That have no adverse effects on the environment.
  - 2. On-site facilities, including: Wash-Pad Sumps / Oil-Water Separator Sumps / Sediment & Storm Drain Sumps / Shop Sweepings
- On-going treatment is a long-term maintenance plan to reduce potential site contamination from increased accumulation of petroleum hydrocarbons;
- Criteria for identifying contamination follow these general guidelines:
  - 1. The depth of contamination does not exceed 0.5m below surface grade:
  - 2. The surface staining is less than 3m in diameter;
  - 3. The volume of contaminated media is less than (<) 5m<sup>3</sup>.

#### In-situ Treatment (see Table 1)

The visible suspect/ contaminated material will not be excavated or removed. All treatment will be performed within the boundaries of the stained/ contaminated area.

#### Spill Assessment:

- Contain and remove any free product:
  - Use petroleum absorbent pads or equivalent absorption product(s) to remove free product prior to treatment

#### **Environmental Assessment:**

- Identify the characteristics of the contaminated media:
  - Clay, Silt and Mud mixtures
  - Sand and Gravel mixtures
  - Pebbles and Cobble mixtures
  - Gravel and mixed fragments
  - Fibric. Silt and Sand mixture
  - Humic. Silt and Sand mixture

#### Bioremediation in-situ Treatment:

- Add treatment product to contaminated area (see Table 1)
  - Dry or liquid product, depending on the media
    - o Dry treatment product: 1 bag/ 1m<sup>3</sup> or as recommended
    - Liquid product: 1L concentrate to 50L water or as prescribed
- Mix treatment product with contaminated media
  - Use excavator, grader or equivalent to ensure a good mix
  - On hard surfaces (i.e. asphalt or cement pads) spread product to absorb, sweep and remove
- Assess the treated area:
  - Check for petroleum hydrocarbon odors & visible staining
- Repeat in-situ treatment if staining or odors persists

#### Ex-situ Treatment (see Table 1)

- Stockpile contaminated media in a mini-biocell for treatment;
  - A small cell lined with 20mil poly and 1m soil cover, a cement pad or equivalent
- Mix treatment product with contaminated media
  - Dry product: 1 bag/ 1m<sup>3</sup> of contaminated media (see Table 1);
  - Use excavator or equivalent to ensure a good mix
  - Aerate with excavator every two weeks
  - Leave uncovered if no precipitation is in the forecast
- Assess the treated area:
  - Check for petroleum hydrocarbon odors & visible staining
- Repeat treatment within biocell if petroleum hydrocarbon odors or staining persist

#### **Disposal Options:**

- Landfill intermediate cover and/or final cover material (Check with Permit requirements)
- On-site restoration (no off-site media relocation permitted):
  - Construct berms, ditches & use to backfill around the site
  - On-site road surface improvements

Table 1. Remedial Options for Media Characteristics.						
Remedial Options for Media	In-situ	In-situ	Ex-situ Bioremediation Cell			
Characteristics	Bioremediation	Bioremediation				
	Dry Product <sup>1</sup>	Liquid Product <sup>2</sup>	Dry-Product			
Clay/ Silt/ Mud	YES		YES			
Sand/ Gravel	YES		YES			
Pebbles/ Cobble		YES	YES			
Gravel/ Mixed Fragments		YES	YES			
Fibric/ Silt/ Sand	YES		YES			
Humic/ Silt/ Sand	YES		YES			
Cement Pad/ Asphalt Road	YES	YES				
Large Rocks & Boulders		YES

# Reference #2A Tarp Containment™ – high energy flow water course

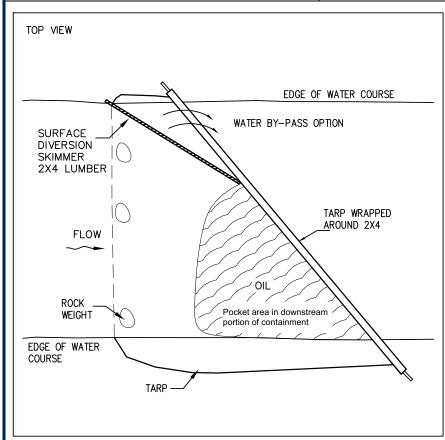

<u>Objective:</u> Surface water control within a confined water course with high flows.

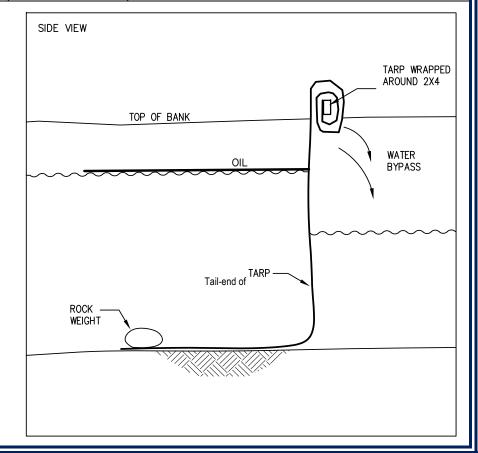

<u>Materials:</u> A tarp that is large enough to span the width of the water course. A crossbeam that is long enough to span water course (i.e. 2x4 lumber). Surface skimmer will be required to allow surface water to by-pass the tarp along the upstream side.

<u>Method:</u> Lay the tarp out and wrap it around the crossbeam (i.e. 2x4 lumber). Place the crossbeam and tarp across the water course. Keep the tail-end of tarp above the water to keep it from filling and sinking.

Angle the crossbeam to approximately 45° angle to create a pocket area within the downstream portion of the containment. Now place the crossbeam and tarp high enough up the embankment so that the oil cannot by-pass the containment. On the upstream side, place the end of the crossbeam low enough so that water will by-pass the containment. Sink the tarp and place a few rocks along the leading edge.

Place a 2x4 lumber across the water to deflect the oil into the pocket of the containment. Monitor and recover product within the pocket of the containment.

# Reference #2A Tarp Containment™ – <u>low</u> energy flow water course

<u>Objective:</u> Surface water control within a confined water course with low flows.

<u>Materials:</u> A tarp that is large enough to span the width of the water course. A crossbeam that is long enough to span water course (i.e. 2x4 lumber). Have enough tarps and lumber to install at least three tarp-containments in series.

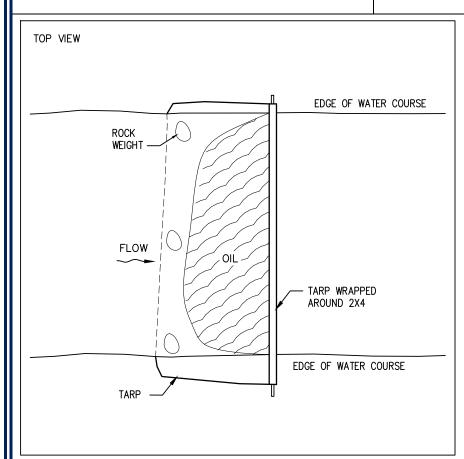

<u>Method:</u> Lay the tarp out and wrap it around the crossbeam (i.e. 2x4 lumber). Place the crossbeam and tarp across the water course. Keep the tail-end of tarp above the water to keep it from filling and sinking.

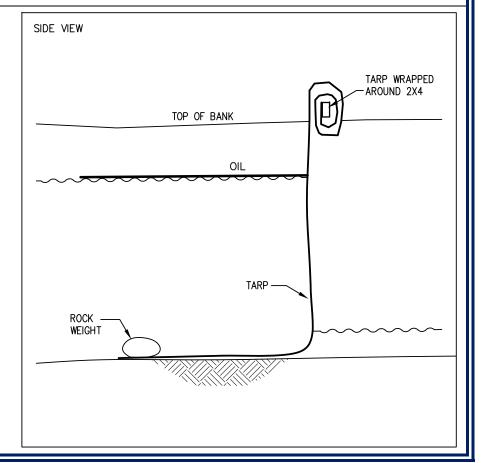

Place the crossbeam at 90° to the water course and high enough up the embankment so water cannot overflow the crossbeam (at least 2').

Sink the tarp and place a few rocks along the leading edge.

Monitor and recover product within the containment.

As surface water control is achieved, the surface product will disperse upstream. Use an absorbent boom to sweep and corral the spill within the containment.

## Reference #2B

## **Culvert Block™**

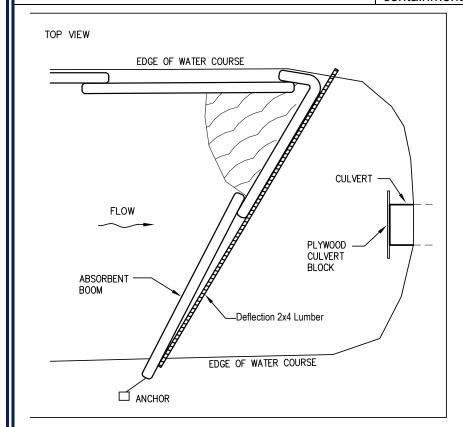

Objective: Containment & recover a spill before it goes through the culvert. Surface water control on the upstream side of the culvert. This containment will also prevent the culvert from getting contaminated with hydrocarbons.

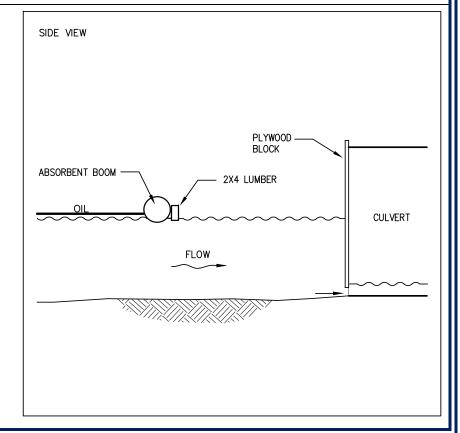

<u>Materials:</u> A piece of plywood large enough to cover the front of the culvert. The larger the culvert diameter (typically 1' to 3'), the thicker the plywood (typically 1/2" to 1"). Use a tarp or poly to help seal the plywood & culvert (not always required).

Method: Attention: In high-flow waters culverts can be extremely dangerous. Always assess the risk before attempting to block a culvert! Remove any large rocks that might prevent the plywood from being flush with the culvert. Place the plywood in front of the culvert so that it seals the entire culvert, then place the tarp over the front of the plywood to seal any gaps.

Once surface water control is obtained use a sandbag to hold the plywood in place. If water level rises too high, adjust the tarp and plywood to allow subsurface water to enter the culvert.

Place a deflection (2x4 lumber) across the water course and line with absorbent booms. Use additional absorbent booms to sweep the oil towards the containment.

## Reference #2C

## Modified Culvert Block™

<u>Objective:</u> Control the sub-surface water flow while allowing the surface water to flow over the containment system. This will allow a dense-no-aqueous-phase-liquid (DNAPL) or solid to collect at the base of the containment.

<u>Materials:</u> A tarp that is large enough to span the width of the water course. A crossbeam that is long enough to span water course (i.e. 2x4 lumber) and the culvert.

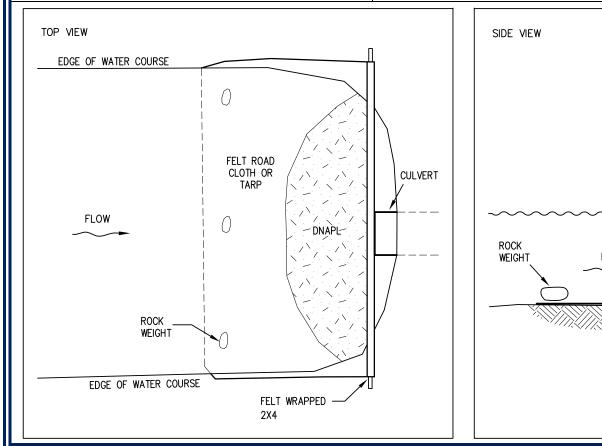

Method: Lay the tarp out and wrap it around the crossbeam (i.e. 2x4 lumber). Place the crossbeam and tarp across the water course in front of the culvert. Keep the tail-end of tarp above the water to keep it from filling and sinking. Place the crossbeam approximately halfway up the culvert.

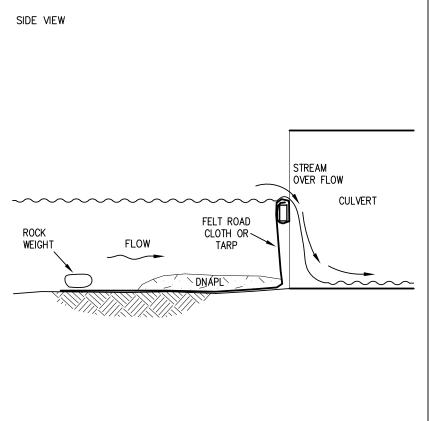

Sink the tarp and place a few rocks along the leading edge.

Allow water to build-up and overflow the containment.

Monitor the build-up of DNAPL or solid at the base of the containment.

Consider a vac-truck to recover product within the containment.

## Reference #2D

# **Underflow Containment™**

<u>Objective:</u> To control the surface water flow while allowing subsurface flow through a series of PVC pipes. Primarily used in surface water drainage ditches along roads, that are not fish-bearing.

<u>Materials:</u> 4" PVC pipes with elbows or **T** attachments; Sandbags filled with pea-gravel and a roll of poly or a tarp.

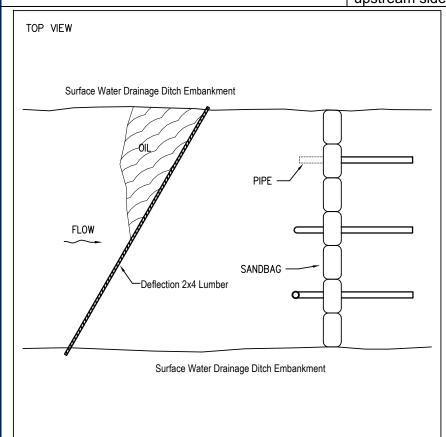

<u>Method:</u> Place the sandbags end-to-end the width of the drainage ditch. Place PVC pipes and cover with another row of sandbags.

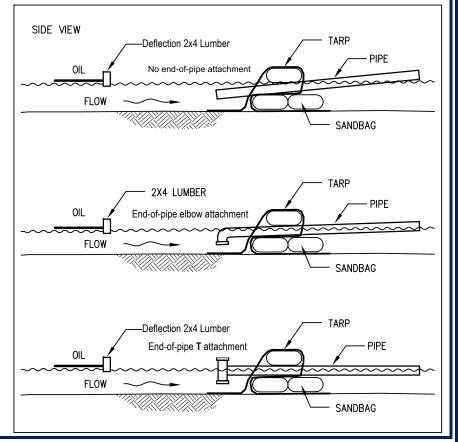

Place elbows or **T** attachments onto end-of-pipe (upstream end) to ensure that the subsurface water enters the pipe and not the oil.

If more than two layers of sandbags are required, consider a base with two side-byside sandbags.

**Long-Term Use:** Consider placing a tarp or poly down and folding it over each layer to seal the sandbags and minimize the leakage. Use Gorilla Tape to seal the tarp to the PVC pipe.

If the ditch is shallow with little or no gradient, consider digging a sump on the upstream side (not shown). This will allow the pipe to extend down into the sump.

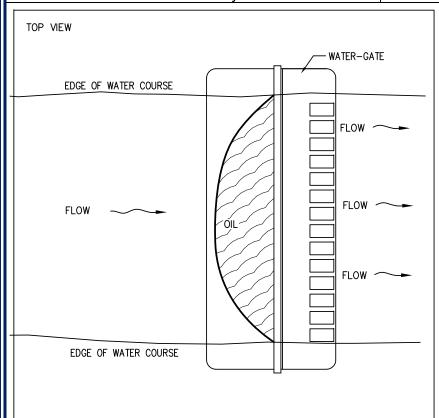

## Reference #2E

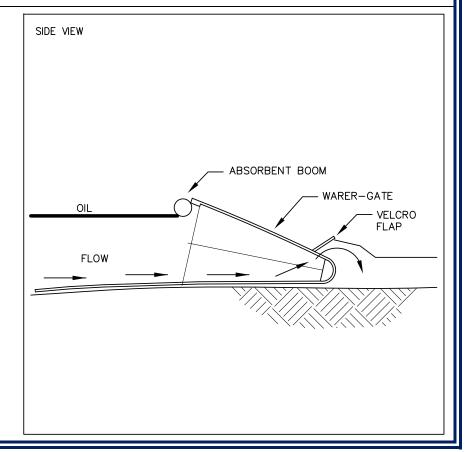

## **Water-Gate™ Containment**

<u>Objective:</u> Used in water courses that are typically too wide for a Tarp Containment. Control the surface water flow while allowing subsurface flow to continue.

Materials: This is an engineered 30' Tarp Containment that does not require a crossbeam as it has a built-in baffle system. There are four sizes available for different depths: small (15"); medium (21" & 28"); & large (39"). A Velcro tongue-and-groove at each end allows the Water-Gate to extend by 30' at a time.

Method: Position the Water-Gate the correct way (as indicated on unit) and roll across the water course. Attach additional units until the Water-Gate spans the width of the water course. Unfold and allow water to enter and fill the baffle system. Once the water level reaches 2/3 up the baffles open several Velcro Flap Valves and allow subsurface water to escape. Monitor the water level so that it remains near the top edge of the Water-Gate. Use an absorbent boom along the top edge and begin recovery by sweeping the surface water and recovering with Sphag Sorb, additional absorbents or a vac truck.

# Reference #2F

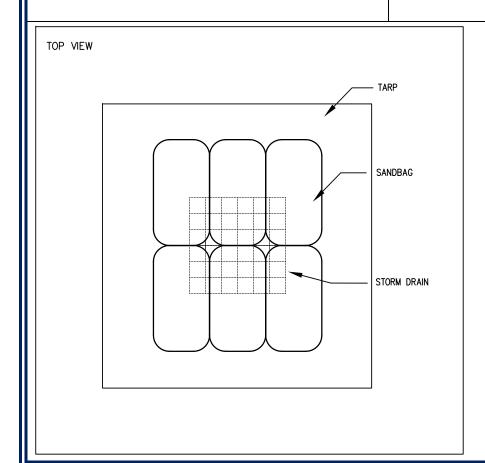

# **Storm-Drain Containment™**

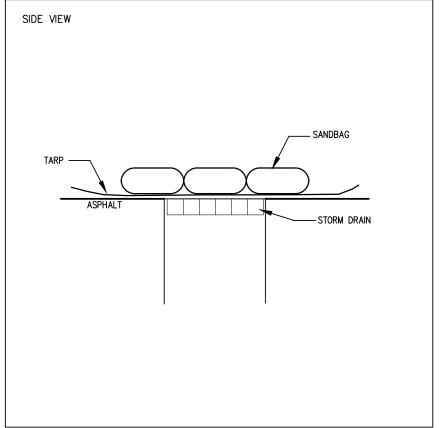

**Objective:** Prevent a spill from entering a storm drain.

Materials: A small tarp and several sandbags.

<u>Method:</u> If time allows, sweep to remove gravel and rocks around the perimeter of the storm drain. Place the tarp over the storm drain and cover the perimeter of the storm drain with sandbags. Step or stomp on the sandbags to help seal the tarp to the ground around the storm drain.

Fold the tarp up over the sandbags to protect them from surface contamination. Monitor and apply pressure or redistribute the sandbags to ensure the entire perimeter is sealed. Add more sandbags if required.

# Reference #2G

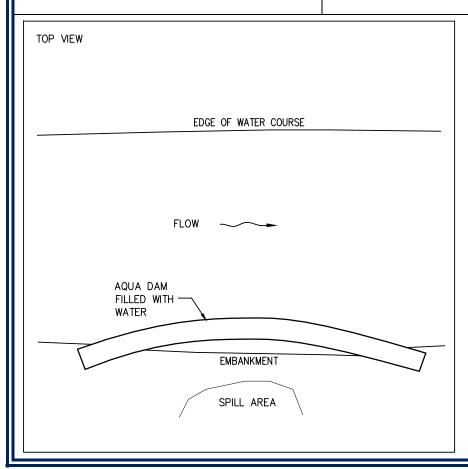

# **Aqua-Dam™ Foreshore Installation**

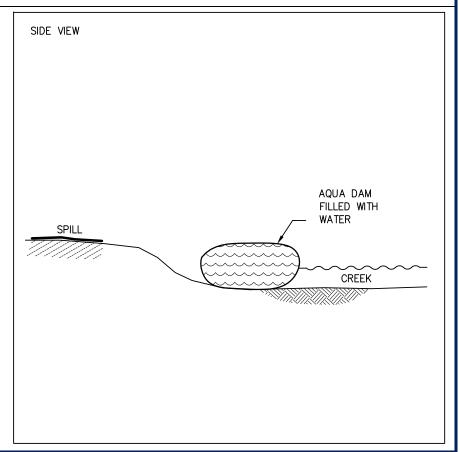

**Objective:** Prior to removing or digging along a foreshore, separate the water course from the foreshore by placing a protective barrier or Aqua-Dam along the foreshore.

<u>Materials:</u> An Aqua-Dam comes in many sizes. For small to medium size creeks, consider a 30m long unit by 2m wide. Water pump with attachments.

<u>Method:</u> Attention! Make sure all applicable Permits. Approvals or Exemptions have been obtained prior to doing any in-stream work, including foreshore removal of contamination. Open the Aqua-Dam and place along the length of the foreshore that requires excavation. Close the downstream end and secure to foreshore. Pull the upstream end up the embankment and secure.

Fill the Aqua-Dam with water from the stream and allow the weight of the unit to seal to the substrate. Begin excavation from the furthest point of the spill and work towards the foreshore embankment. Use a vac truck to remove contaminated surface water from the excavation. The last bit of excavation should be the remaining berm along the Aqua-Dam.

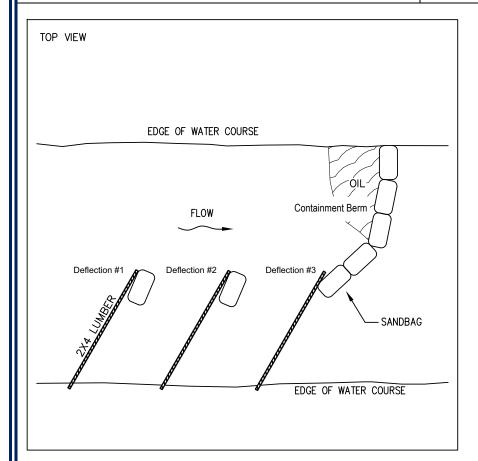

# Reference #2H

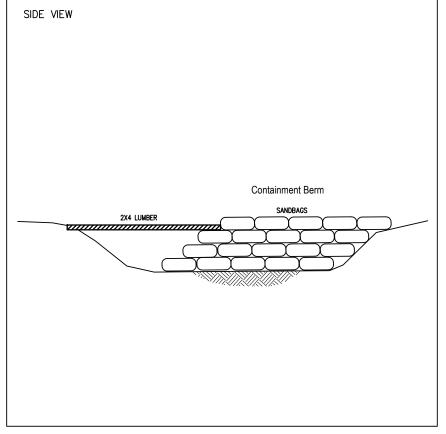

# Sandbag Containment™

<u>Objective:</u> Surface water deflection into a sandbag containment berm.

<u>Materials:</u> Sandbags (20x) to build the in-stream containment berm. A roll of poly or a tarp to place over the sandbags and make it more functional for containment. Several 2x4 lumber to deflect the surface water into the berm.

**Method:** Place the sandbags in the stream, moving at an approximate 45° angle from the foreshore upstream. This will create a "pocket" for the oil to collect in. Place the tarp or poly overtop of the berm to help seal the gaps between the sandbags. This will also protect them from contamination. Position several upstream deflection units (2x4 lumber) to force surface water into the sandbag containment system.

# Reference #2I

## **Ice Containment™**

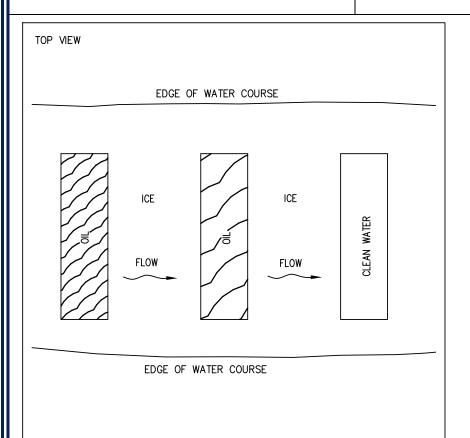

**Objective:** Contain and recover oil that is under the ice within a moving stream.

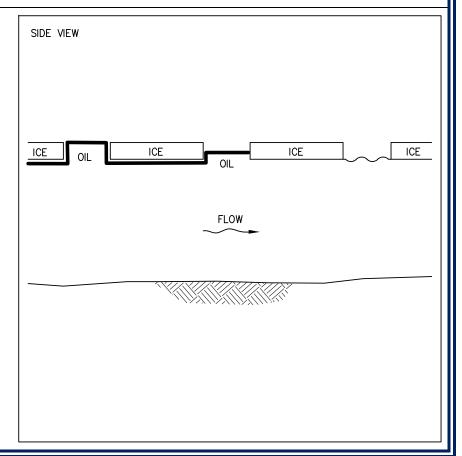

Materials: A chainsaw, ice hooks or an excavator.

<u>Method:</u> Attention! Assess the ice thickness, depth of water and the flows prior to working on the ice.

Use a chainsaw to cut the ice into large blocks approximate 1m by the approximate width of the stream. Remove the ice with an excavator or by hand using ice-hooks. The oil will corral within the open water of the ice containment. Cut several more downstream. The last downstream containment should be used to confirm that no hydrocarbons have migrated beyond the upstream containments.

Recover using a vac truck or by hand using absorbents followed by Sphag Sorb.

# Reference #3A

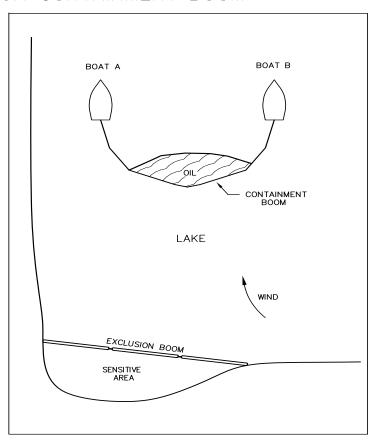

# **Containment Boom - OPEN Water**

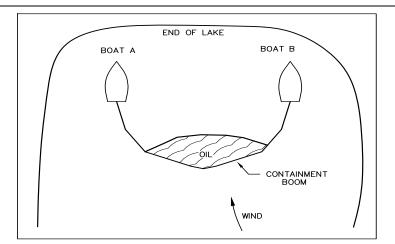

<u>Objective:</u> Corral an oil slick on open water using containment booms on inland lakes or large rivers

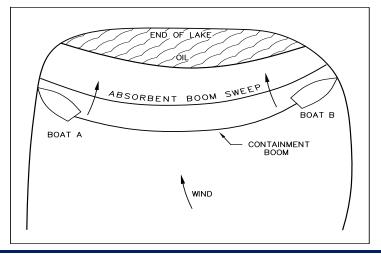

<u>Materials:</u> At least two displacement boats and several 100 feet of 6" (or deeper) river containment boom.

<u>Method:</u> Corral the surface oil slick using the containment boom stretched between two boats. Move with the wind towards the shoreline where oil has accumulated. Place an absorbent boom inside the length of the containment boom and sweep to oil towards shore to corral and recover the oil. In remote locations, there are multiple recovery options including portable vacuum systems, skimmers and manual recovery with absorbents.

#### 3A CONTAINMENT BOOM

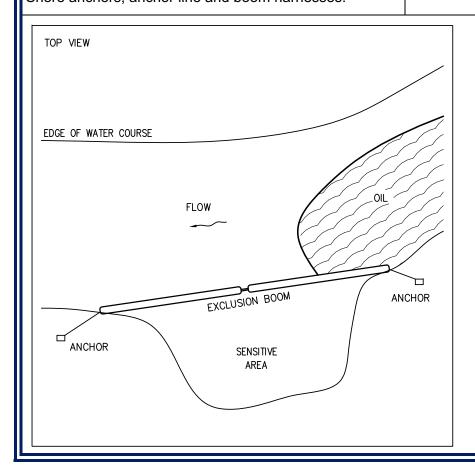

# Reference #3B

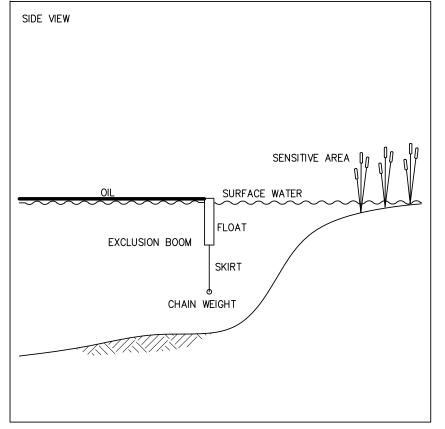

## **Exclusion Boom**

**Objective:** Deflect an oil slick from impacting a sensitive area using containment booms on inland lakes or large rivers. The containment boom should be stretched along a section of foreshore that requires protection.

<u>Materials:</u> Enough lengths of river containment booms to reach across a sensitive area. If possible, deploy the river containment boom manually. Alternatively, a boat will be required to pull the boom into position. Shore anchors, anchor line and boom harnesses.

**Method:** Ideally, this section of foreshore would have been identified during the risk assessment period when developing Prevention & Preparedness. The length, depth and deployment method would have been established. Alternatively, assess the sensitive area, conditions of the water course, safety considerations and options for environmental protection. To be effective, deployment of an exclusion boom should be done as soon as possible. Monitor the sensitive area to determine the effectiveness of the exclusion boom. Make *in-situ* adjustments to ensure the sensitive area is protected as much as reasonably possible.

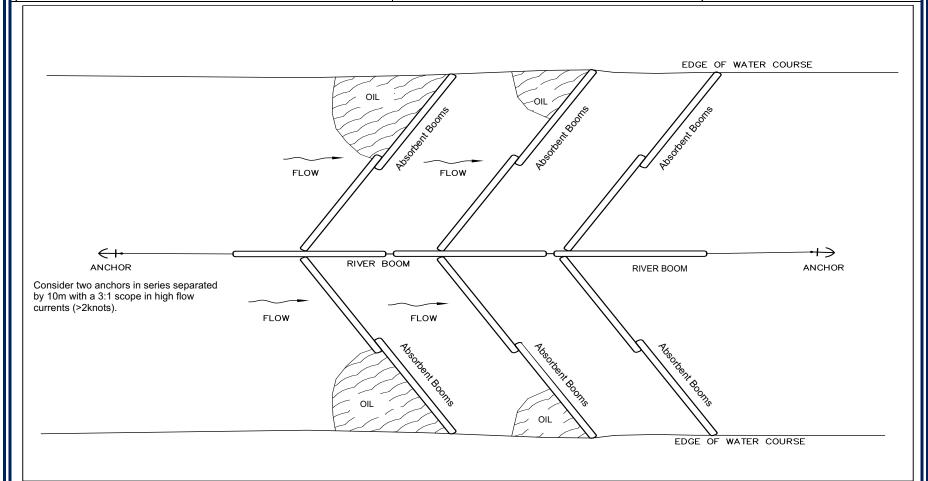

# Reference #3C Herring-Bone Configuration™ Confined Water Course

<u>Objective:</u> Deflect surface contamination towards the shoreline for recovery.

**Materials:** A length of river boom, anchors, anchor lines and boom harness. Absorbent booms with poly rope to pull the boom towards the foreshore.

<u>Method:</u> In shallow water courses, deployment may be done manually. In larger water courses a river boat is required.

Deploy river boom and then attach absorbent booms. Once attached, pull the absorbent booms to the foreshore to deflect and contain the surface oil slick. The angle will require adjusting so keep monitoring the effectiveness. At a minimum, use three deflection booms, more if possible.

# Reference #3C Herring-Bone Configuration™ Open Water Course

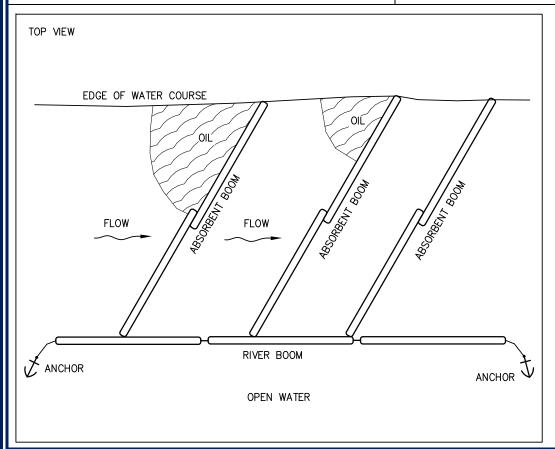

<u>Objective:</u> Deflect surface contamination towards the shoreline for recovery. In large, open water rivers, consider deploying the river boom only towards one shoreline.

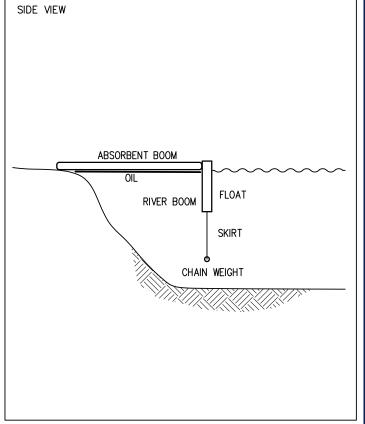

<u>Materials:</u> A length of river boom, anchors, anchor lines and boom harness. Absorbent booms with poly rope to pull the boom towards the foreshore.

**<u>Method:</u>** In large, open water rivers, a river boat is required.

Deploy river boom with the current flow and then attach absorbent booms. Once attached, pull the absorbent booms to the foreshore to deflect and contain the surface oil slick. The angle will require adjusting so keep monitoring the effectiveness. At a minimum, use three deflection booms, more if possible.

Work with the river current to capture the natural deflection zone and deep pools where water current is slower, and booms are more effective.
